Databasis is a flexible, very fast electronic filing system for use with the 1541 disk drive. Databasis 128 contains powerful commands for searching, sorting, listing, erasing etc. and - of course - in a user-friendly style. With this program every Commodore owner is able to make his own database for addresses, records, videotapes, membership rolls etc. Not less than 85,000 characters can be put into memory at one time. This means that, for example, each address from your database will be brought up on your screen in a split second. You can sort or search on each subject you want. Do you want a telephone number from all your London addresses...just give your computer the right instructions and your wanted telephone number pops up faster than you can think. Or do you want an address listing in postcode order? Databasis 128 takes care of it. The enclosed manual will teach you how to work with this extremely powerful program. Databasis 128 produces conveniently arranged menu's and easy to handle cards. This enables you to look for- or list data simply by pressing a key. In fact all disk functions have been put into this program e.g. loading, saving, erase and consult data. For the many users of Databasis Cassette a special program is enclosed that enables them to copy from cassette to disk. A very useful asset of Databasis 128 is the possibility to split up your data in parts or to rearrange your existing cards, even after data has been loaded. A build-in Centronic Interface makes it possible to use almost every available printer. Complete functions for the printer are available e.g. passing control codes, choice of size and type of paper to be used. In brief, a professional and -above all -very userfriendly program.

- high speed
- professional
- user friendly
- manual included
- all printers
- a great number of examples

To load the program:
press '*' 8,1
